# Plebum Dominium

*(PLAY-boom doh-MIN-ee-oom)*

## Absolute Ownership by the Common People

"Pleb" is an everyday Bitcoiner. "Dominium" is Latin for absolute ownership. This guide is for the Bitcoiner who wants to build a secure, self-custody Bitcoin wallet from the ground up — bypassing the need for a company, an app, or a custodian to manage or store it.

## Why this guide: eliminate single points of failure

This guide does that — securely and privately. None of these can take your money:

- One seed that can spend by itself
- An app or an exchange
- One place
- One device, one company
- A photo, a note, or a password manager

## The process, start to finish

Seven steps. Each one links to its sheet. Nothing is skipped, nothing is reordered.

### 1. Check the files
Every file comes from its own site. Hash and signature are checked — if either fails, the file is deleted. Two tools must agree before the work continues.

### 2. Two boots
The same computer, used twice. The first boot stays on the network and only watches. The second boot is Tails — network off, one seed, then a full shutdown.

### 3. Make the keys
Casino dice make the randomness. Faces 1–4 are kept, 5 and 6 are rolled again. The computer shuts down between keys. Two programs must print the same 24 words.

### 4. Two of three
The wallet needs any two of the three keys to spend. One key alone cannot move the long-term fund.

### 5. Practice spend
A small amount comes in. The first seed signs, the computer shuts down, the second seed signs — then the payment is broadcast. Savings don't move until this works.

### 6. Metal + map
The three keys are stamped into titanium and kept at three addresses. The wallet map travels with the record of those places — and the map is not another key.

### 7. House rules
The limits of the method. A convenience is never allowed to break one of them.

## House rules

- **No photos** — No seed, plate, or word-bearing screen on a camera.

scan for the full sheet

- **Networking off before the seed** — A seed never sits on a machine that had the network up.
- **One seed / boot** — Load Seed 1. Sign. Full shutdown. Then Seed 2.
- **Hash fails → stop** — Do not improvise. Redownload from the project's own site.
- **Hardware later** — Optional signer. Different vendors if more than one.
