Check the files

Time	Difficulty	Steps	You will need
30 min	Careful	7 sections	The downloaded files · Two verification tools

Every file gets checked before the computer goes offline, and a file that fails is deleted, no exceptions. A compromised file compromises the funds.

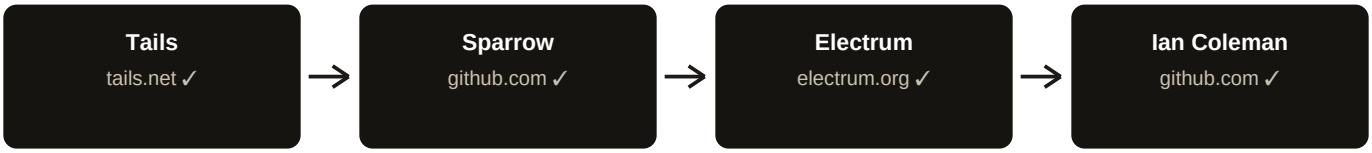
> **WARNING**
>
> **Is this the real site?** These instructions only protect you on **plebumbtc.io**. Before you trust them: check the address bar. The domain must read exactly `plebumbtc.io`, no extra words, no lookalikes. Click the lock icon and confirm the certificate belongs to plebumbtc.io. Anyone can copy these pages; only the real domain gets the real updates. If anything looks wrong, stop. Verify through a second channel before continuing.

What is required

- The downloads from the checklist: Tails 7.16 or later 7.x (verified), Sparrow 2.5.5, Electrum 4.8.3, the Ian Coleman page, and the dice converter from this kit.

Tails: download only from tails.net, and verify the file's signature and checksum before using it for the guide. A later 7.x release is allowed only if its signature and checksum verify and the boot steps still match. Sparrow and Electrum must match exactly.

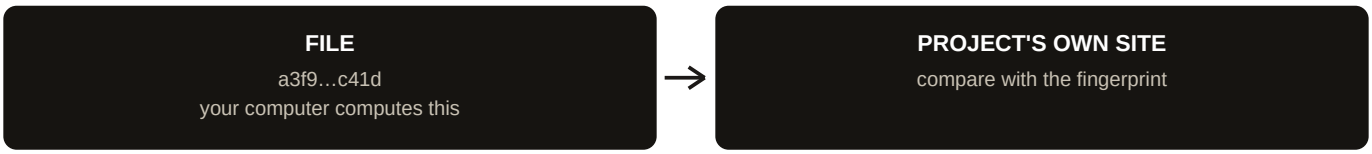
Step 1 · Download only from the real sites.



NOT A LOOK-ALIKE PAGE · NOT FROM THIS SITE (EXCEPT THE DICE CONVERTER)

Sparrow must be 2.5.5 exactly. A newer download will not match. That is a stop, not an upgrade. The dice converter and the wallet descriptor tool are the two files this site provides; their fingerprints are in VERIFY.md. Both are on the downloads page.

Step 2 · Compare the fingerprint. Every character.



EVERY CHARACTER MATCHES ✓ · ONE DIFFERS = DELETE

Windows: PowerShell → Get-FileHash. Mac: Terminal → shasum -a 256. Paste the result next to the fingerprint published on the project's own site.

Step 3 · Check the signature. Want: "Good signature".

scan for the full sheet

```
$ gpg --verify sparrow-2.5.5-manifest.txt.asc
gpg: Good signature
gpg: WARNING: This key is not certified with a trusted signature!
```

THAT WARNING IS NORMAL. THE FINGERPRINT MATCH IS WHAT MATTERS

Import the signing key, confirm its fingerprint, then verify. The "not certified" warning is normal on first import. What matters: the line says Good signature and the fingerprint matches.

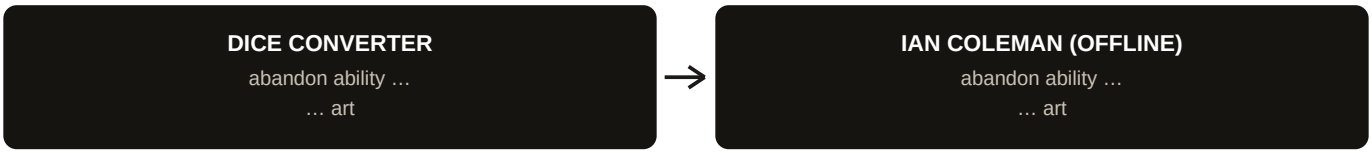
Sparrow signing key fingerprint: D4D0D3202FC06849A257B38DE94618334C674B40. Electrum (ThomasV): 6694D8DE7BE8EE5631BED9502BD5824B7F9470E6.

Step 4 · Run the kit check.

```
$ ./verify_kit.sh
tails-amd64-7.16.img … PASS
sparrowwallet-2.5.5 … PASS
dice-converter … PASS
```

Put the downloads next to verify_kit.sh and run it. It checks the pinned fingerprints. One failure: the work stops.

Later · Two tools must agree. Every time.



SAME BITS → SAME WORDS · SAME SEED → SAME ADDRESSES · SAME PAYMENT DETAILS

Same dice bits → same 24 words in both tools. Same seed → same first addresses in Sparrow and Electrum. The wallet map shows those same addresses. Before signing, both tools show the same destination, amount, change, and fee. If they differ, stop.

STOP IF

- A fingerprint differs by one character: delete the file.
- The signature isn't Good: delete the file.
- The two tools disagree: stop.

Next, Two boots.
