Independent At-Home Bitcoin Self-Custody

Plebum Dominium

(PLAY-boom doh-MIN-ee-oom)

Absolute Ownership by the Common People

“Pleb” is an everyday Bitcoiner. “Dominium” is Latin for absolute ownership. This site is for the Bitcoiner who wants to build a secure, self-custody Bitcoin wallet from the ground up, bypassing the need for a company, an app, or a custodian to manage or store access to their funds.

This guide shows you how to generate entropy with dice, import it into verified software, and stamp a 2-of-3 multisig wallet into titanium. Hardware wallets are completely optional.

Why this guide: eliminate single points of failure

This guide does that, securely and privately. None of these can take your money:

- One seed that can spend by itself
- An app or an exchange
- One place
- One device, one company
- A photo, a note, or a password manager

The process, start to finish

Seven steps, one optional pre-sheet, one optional detour. Each one links to its sheet. Nothing is skipped, nothing is reordered.

1. Before you begin (optional)
Five minutes with a pencil. Check the threats you actually care about. The guide answers each one. This method exists for people who checked **theft and disaster**.

2. Check the files
Every file comes from **its own site**. Hash and signature are checked. If either fails, the file is **deleted**. Two tools must agree before the work continues.

3. Two boots
The same computer, used twice. The **first boot** stays on the network and only watches. The **second boot** is Tails: network off, one seed, then a full shutdown.

4. Make the keys
Casino dice make the randomness. Faces **1–4 are kept**, 5 and 6 are rolled again. The computer shuts down between keys. **Two programs must print the same 24 words.**

5. Two of three
The wallet needs **any two of the three keys** to spend. One key alone cannot move the long-term fund.

6. Rehearse on testnet (optional)
The entire flow with **worthless coins** before any plate exists. Same clicks as mainnet, mistakes cost nothing. The plates come after you’re bored of succeeding on testnet.

Stop if a check fails. Do not skip ahead.

7. Practice spend
A **small amount** comes in. The first seed signs, the computer shuts down, the second seed signs. Then the payment is broadcast. Savings don’t move until this works.

8. Metal + map
The three keys are **stamped into titanium** and kept at three addresses. The wallet map travels with the record of those places, and the map is **not another key**.

9. House rules
The limits of the method. A convenience is **never** allowed to break one of them.

House rules

Five rules. They hold for every sheet, every boot, every time.

- **No photos**: No seed, plate, or word-bearing screen on a camera.
- **Networking off before the seed**: A seed never sits on a machine that had the network up.
- **One seed / boot**: Load Seed 1. Sign. Full shutdown. Then Seed 2.
- **Hash fails → stop**: Do not improvise. Redownload from the project’s own site.
- **Hardware later**: Optional signer. Different vendors if more than one.

Stop if a check fails. Do not skip ahead.
